Mehta, Ashwin Monday, April 28, 2003 3:57 PM STIC-Biotech/ChemLib sequence search

STIC.

Please search the commercial and interference databases for the nucleotide sequences of SEQ ID NOs: 5 and 6 from 09/810,764.

My mail room is 9E12, office 9E07, art unit 1638.

Thank you, Ashwin Mehta

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         qq
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, massuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing particularly L-lysine. The present sequence is a protein described in the exemplification of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the European Patent Office.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               0;

AAA65809 to AAA65889 and AAA66058 to AAA66138 represent nucleotide sequences derived from Escherichia coli which inhibit E. coli proliferation. AAA65809 to AAA66055 and AAB15806 to AAA65809 to AAA66055 and AAB15806 to AAA65090 to AAA66055 and AAB15806 to AAA6605 and Proliferation inhibiting nucleotide inserts in an example from the present invention. Methods from the present invention can be used to identify a proliferation. This proliferation inhibiting an example from the present invention. Methods from the present invention and be used to identify a proliferation-required gene in a microorganism, by contacting an microorganism with a proliferation-required gene activity inhibitory nucleic acid identified in another organism, and determining if inhibition occurs in the second microorganism. The nucleic acid sequences identified as being required for bacterial growth and proliferation, can be used for antisense therapy for killing bacteria.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Ohlsen KL, Trawick J, Forsyth RA, Froelich JM, Carr GJ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAU35466
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              δ
                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are consistent that the constant of the prokaryotes used are premoniae, Pseudomonas aeruginosa and Enterococcus facetalis. The pneumoniae, Pseudomonas aeruginosa and Enterococcus facetalis. The cinvention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins. The proteins can be used to screen compounds in rational drug discovery or programmes. The antisense nucleic acids equence is also useful to screen corporation of the proteins and evalety of organisms. The present sequence represents an avide variety of organisms. The present sequence represents an avide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein.

Consential prokaryotic cellular proliferation protein.

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential comes, their use in the discovery of novel antibiotics, the essential comes, their use in the discovery of novel antibiotics, the essential comes, themselves and the encoded proteins. The prokaryotes used are pneumoniae, Pseudomonas aeruginosa and Enterococcus facealis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen correction suclets acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein.

Contact the printed specification, but was obtained in electronic format directly from WIPO at the printed specification, but was obtained in electronic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to antisense inhibitors of genes essential to prokatyotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokatyotes used are scherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, Pseudomonas aeruginosa and Enterococcus facealis. The Invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to antibiotic development. The antisense nucleic acids can also be used to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an antibotic cellular proliferation protein.

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, Pseudomonas aeruqinosa and Enterococcus faccalis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to expressed proteins, and to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein.

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are scherichia coli, Staphylococcus aucus, Salmonella typhi, Klebsiella preumoniae, Pseudomonas aeruginosa and Enterococcus faccilis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to invention antibodies capable of binding to the expresse proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen corrections in the sequence data for this patent for the required for cell proliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein.

Con the printed specification, but was obtained in electronic form part contains the printed specification, but was obtained in electronic contains the printed probablished_pct_sequences.

The advantage of this change is that the limiting factor for the prodn. of elfamycin by actinomycetes is removed by mutating the gene tuf into tuff encoding a protein, resistant to the elfamycin, pref. mochange; (Lirromycin). The invertors claim EF-TuR and the genes (tufR) encoding it.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence of translation elongation factor Tu2 encoded by tuf2 gene.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  396 AA;
```

```
Substitution of residue 378 of the elongation factor (EF-Tu) with a valine, threonine, proline or phenyalanine results in an elfamycin resistrant protein (EF-TuR). The advantage of this change is that the limiting factor for the prodn. Of elfamycin by actinomycetes is removed by mutating the gene tuf into tufR encoding a protein, resistant to the elfamycin, pref. mocimycin (Kirromycin). The inventors claim EF-TuR and the genes (tufR) encoding it.
                New protein conferring resistance to elfamycin - used to
                                       transform streptomycetes to resistant phenotype
                                                                                      Example; Pages 16-18; 35pp; English.

WPI; 1992-017874/03. N-PSDB; AAQ20218 New protein conferring resistance to elfamycin - used to transform streptomycetes to resistant pheno-type

Claim 6; Pages 13-15; 35pp; English.

Substitution of residue 378 of the elongation factor (EF-Tu) with a valine, threonine, proline or phenyalanine results in an elfamycin resistant protein (EF-TuR). The advantage of this change is that the limiting factor for the prodn. Of elfamycin by actinomycetes is removed by mutating the gene tuf into tuff encoding a protein resistant to elfamycin, pref. mocimycin (Kirromycin). The inventors claim EF-TuR and the genes (tufR) encoding it.

translation elongation factor EF-Tu.B precursor, chloroplast - wood tobacco C;Species: Nicotiana sylvestris (wood tobacco)
C;Species: Nicotiana sylvestris (wood tobacco)
C;Accession: S56184, S37675; S46549; S40615
R;Murayama, Y.; Matsubayashi, T.; Sugita, M.; Sugiura, M.
Plant Mol. Biol. 22, 767-774, 1993
A;Fille: Purification of chloroplast elongation factor Tu and cDNA analysis in tobacconsideration of chloroplast elongation; PMID:8358028
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        A:Title: Structure and differential expression of two distinct genes encoding the chi
A:Reference number: S40614; MUID:94373864; PMID:8087886

                                                                                                       -i-SUBCELLULAR LOCATION: Cytoplasmic.
-i-SIMILARITY: BELONGS TO THE GTP-BINDING ELONGATION FACTOR FAMILY.
EF-TU/EF-1A SUBFAMILY.
Submitted (DEC-1996) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: THIS PROTEIN PROMOTES THE GTP-DEPENDENT BINDING OF
AMINOACYL-TRNA TO THE A-SITE OF RIBOSOMES DURING PROTEIN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match 76.7%; Score 69; DB 1; Length 397; Best Local Similarity 73.7%; Pred. OM protein - protein search, using sw model

Run on: April 29, 2003, 09:39:04; Search time 29 Seconds (without alignments)

Title: US-09-810-764A-5

Perfect score: 90
Sequence: 1 RGKFERTKPGVNIGTIXXV 19
Scoring table: BLOSUM62

Scoring table: BLOSUM62

Searched: 262574 seqs, 29422922 residues

Total number of hits satisfying chosen parameters: 262574

Minimum DB seq length: 2000000000

Maximum Match 100%
Listing first 45 summaries
```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

AP004023 138931 bp DNA linear HTG 21-MAR-2002 Oryza sativa (japonica cultivar-group) chromosome 2 clone 0.31126_D09, *** SEQUENCING IN PROGRESS ***, in ordered pieces. AP004023 DEFINITION ACCESSION

AP004023.1 GI:15130685 HTG; HTGS_PHASE2. VERSION KEYWORDS SOURCE

Oryza satīva (japonica cultivar-group) (cultivar:Nipponbare) DNA, clone:OJ1126_D09. ORGANISM

Oryza sativa (japonica cultivar-group) Eukaryota, Viridiplantae, Streptophyta, Embryophyta, Tracheophyta, Spermatophyta, Magnoliophyta, Liliopsida, Poales, Poaceae; Enrhartoideae, Oryzeae, Oryza.

REFERENCE

```
combining Monsand and RGF-Japan sequencing data.

NOTE: It currently consists of 1 contigs. Gaps between the contigs are represented as runs of N. The order of the pieces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that have provided by the submitter. This sequence will be replaced by the finished sequence as soon as it is available and the accession number will be preserved.

* NOTE: This is a "working draft' sequence."
